AINAHAU GOES DRY

NAUTICALLY SPEAKING

DIKE BARS FLOODS

Floods in the Ainahau district are now a matter of interest to historians only.

This is in effect the announcement made yesterday by F. William Thrum, assistant engineer of the public works department.

Flooding of the Ainahau section in the future will be prevented, he states, due to the interception yesterday of Piinaio and Hamohamo creeks by a dike built by the dredger now cutting the drainage canal in the reclamation area. The first stream flows between Outrigger club and the Moana hotel, the second flowing beneath Kalakaua avenue waikiki of Kealohilani avenue.

The interception of the streams, Thrum points out, will drain off their waters into the canal and eliminate the possibility of overflows during the rainy season. Waste from the dredger is being used to fill the makai stream beds.

The job was completed in two days under the direction of H. C. Vida, superintendent of the dredger.

It took 4000 cubic yards of coral waste material to complete this part of the project.
